Ex: $\quad$ Show the minimum logic circuit (i.e., using logic gates) to implement the following expression. You may use AND, OR, EX-OR, and NOT (inverter) gates. The optimal design has the minimum total number of gate inputs.

$$
F=A B+\bar{A} C+\bar{C}
$$

Sol'n: We have the following truth table for $F$ versus $A, B$, and $C$ :

| $A$ | $B$ | $C$ | $A B$ | $\bar{A} C$ | $\bar{C}$ | $F$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 1 | 0 | 1 | 0 | 1 |
| 0 | 1 | 0 | 0 | 0 | 1 | 1 |
| 0 | 1 | 1 | 0 | 1 | 0 | 1 |
| 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| 1 | 1 | 0 | 1 | 0 | 1 | 1 |
| 1 | 1 | 1 | 1 | 0 | 0 | 1 |

One simple solution is to use a 3-input NAND gate:

$$
F=\overline{A \bar{B} C}
$$

Applying De Morgan's theorem, we can use a 3-input OR gate:

$$
F=\bar{A}+B+\bar{C}
$$

Applying De Morgan's theorem to A and C, we get another solution with the same number of gate inputs:

$$
F=\overline{A C}+B
$$

The three designs, shown below, all have five gate inputs:
