1. Give numerical answers to each of the following questions:
a) Rationalize $\frac{1-j \sqrt{3}}{1+j \sqrt{3}}$. Express your answer in rectangular form.
b) Find the polar form of $[(j+1)(-1-j)]^{*}$. (Note: the asterisk means "conjugate".)
c) Find the following phasor: $\mathrm{P}\left[-\sin \left(100 t+45^{\circ}\right)\right]$.
d) Find the magnitude of $\frac{(30-j 40)}{(7-j 24) e^{j 30^{\circ}}}$.
e) Find the imaginary part of $\frac{6-j}{3 j}$.
2. 

Choose an $R$, an $L$, or a $C$ to be placed in the dashed-line box to make

$$
i_{1}(t)=\mathrm{I}_{\mathrm{O}} \sin \left(500 t+125^{\circ}\right)
$$

where $I_{0}$ is a positive, (i.e., nonzero and non-negative), real constant. State the value of the component you choose.
3. With your component from part (a) in the circuit, calculate the resulting value of $I_{0}$.
4.

Draw a frequency-domain equivalent of the above circuit. Show a numerical phasor value for $v_{\mathrm{s}}(t)$, and show numerical impedance values for $R, L$, and $C$. Label the dependent source appropriately.
5. Find the Thevenin equivalent (in the frequency domain) for the above circuit. Give the numerical phasor value for $\mathbf{V}_{\mathrm{Th}}$ and the numerical impedance value of $z_{\mathrm{Th}}$.
