## (Each problem is worth double points)

1. 

The above circuit operates in linear mode. Derive a symbolic expression for $v_{0}$. The expression must contain not more than the parameters $v_{\mathrm{s} 1}, v_{\mathrm{s} 2}, R_{1}, R_{2}, R_{3}, R_{4}$, and $R_{5}$.
2. Using the solution for Problem 1: if $v_{\mathrm{s} 1}=0 \mathrm{~V}$ and $v_{\mathrm{s} 2}=1 \mathrm{~V}$, find the value of $R_{5}$ that will yield an output voltage of $v_{\mathrm{o}}=1 \mathrm{~V}$.
3. Using the circuit in Problem 1: Find the numerical value of the circuit's input resistance, $R_{\mathrm{in}}$, as seen by source $v_{\mathrm{s} 2}$. In other words, write a formula for voltage, $v_{\mathrm{s} 2}$, divided by $i_{2}$ :

$$
R_{\mathrm{in}} \equiv \frac{v_{s 2}}{i_{2}}
$$

Write $R_{\text {in }}$ in terms of not more (and possibly less) than $R_{1}, R_{2}, R_{3}, R_{4}$, and $R_{5}$.
4.

Rail Voltages $= \pm 9$
After being at $\mathbf{c}$ for a long time, the switch moves to $\mathbf{d}$ at time $t=t_{\mathrm{o}}$.

a) Choose either an $R$ or $C$ to go in box $\mathbf{a}$ and either an $R$ or $C$ to go in box $\mathbf{b}$ to produce the $v_{\mathrm{o}}(\mathrm{t})$ shown above. Use at least one $R$, and use $2 \mathrm{k} \Omega$ for the $R$ value or values. Also, note that $v_{\mathrm{O}}$ stays low forever after $\mathrm{t}_{\mathrm{o}}+25 \mu \mathrm{~s}$. Specify which element goes in each box and its value.
5. Sketch $v_{1}(t)$, showing numerical values appropriately.
6. Sketch $v_{2}(t)$, showing numerical values appropriately.
7. Sketch $v_{3}(t)$. Show numerical values for $t<t_{\mathrm{o}}$, for $t_{\mathrm{o}}<t<t_{\mathrm{o}}+25 \mu \mathrm{~s}$, and for $t>t_{\mathrm{O}}+25 \mu \mathrm{~s}$. Use the ideal model of the diode: when forward biased, its resistance is zero, (a wire); when reverse biased, its resistance is infinite, (an open).
8.

A frequency-domain circuit is shown above. Write the value of phasor current $\mathbf{I}_{1}$ in rectangular form.
9. Given $\omega=25 \mathrm{krad} / \mathrm{s}$, write a numerical time-domain expression for $i_{1}(t)$, the inverse phasor of $\mathbf{I}_{1}$.
10.

(a) If we attach $R_{\mathrm{L}}$ to terminals $\mathbf{a}$ and $\mathbf{b}$, find the value of $R_{\mathrm{L}}$ that will absorb maximum power.
(b) Calculate the value of that maximum power absorbed by $R_{\mathrm{L}}$.
