## ECE1050 Exam 3 given: Fall 02 <br> (The space between problems has been removed.)

1. (19 pts) a) Draw the asymptotic Bode plot (the straight-line approximation) of the filter circuit below.

Accurately draw it on the graph provided. $\mathrm{V}_{\text {in }}$ is the input and $\mathrm{V}_{\mathrm{L}}$ is the output of this circuit.
To be eligible for partial credit, show the steps you use to get the Bode plot. That is, show things like the transfer function, the corner frequency(ies) , the approximations of the transfer function in each frequency region, etc..

Notice that this graph is in Hz , not rad/sec
Magnitude plot H(f)

Frequency
b) The asymptotic Bode plot is not exact. The actual magnitude of the transfer function can be a little different than the straight-line approximation. For the frequency where this difference is largest, fill in the blanks in the line below.

The actual magnitude is $\qquad$ dB $\qquad$ lower than the Bode plot at $\qquad$ Hz . (Circle one)
2. ( 15 pts ) A feedback system is shown in the figure. What is the transfer function of the whole system, with feedback.

$$
\mathrm{H}(\mathrm{~s})=\frac{\mathrm{X}_{\mathrm{out}}(\mathrm{~s})}{\mathrm{X}_{\mathrm{in}}(\mathrm{~s})}=?
$$

## ECE1050 Exam 3 given: Fall 02 p2

3. (26 pts) R, L, \& C together are the load in the circuit shown.

Find the following: Be sure to show the correct units for each value.
a) The real power. $P=$ ?
b) The reactive power. $Q=$ ?
c) The complex power. $\mathbf{S}=$ ?
d) The apparent power. $|\mathrm{S}|=$ ?
e) The power factor. $\mathrm{pf}=$ ?
f) The power factor is: i) leading
ii) lagging
(circle one)

g) The three components of the load are in a box which cannot be opened. Add (draw it) another component to the circuit above which can correct the power factor (make pf =1). Show the correct component in the correct place and find its value. This component should not affect the real power consumption of the load.
4. (26 pts) Analysis of the circuit shown yields the characteristic equation and $s$ values below.

The switch has been in the closed position for a long time and is opened (as shown) at time $t=0$. Find the initial and final conditions and write the full expression for $\mathrm{v}_{\mathrm{C}}(\mathrm{t})$, including all the constants that you find

Clearly show important numbers (like initial and final conditions) to get partial credit. If you can't find some of these, guess so that you can move on and demonstrate what you do know.
$0=s^{2}+\frac{R_{2}}{L} \cdot s+\frac{1}{L \cdot C}$
$s_{1}:=-5000 \cdot \frac{1}{\sec } \quad$ and $\quad s_{2}:=-5000 \cdot \frac{1}{\sec }$

5. (14 pts) For waveform shown, find:
a) Average $\mathrm{DC}\left(\mathrm{V}_{\mathrm{DC}}\right)$ value
b) RMS (effective) value

## Answers

1.b) 3 , lower, 3024
2. $\frac{30 \cdot s^{2}+1800 \cdot s}{s^{2}+10 \cdot s-4800}$
$\begin{array}{lll}3 . a) \\ 2.69 \mathrm{~kW} & \text { b) } 718 \mathrm{VAR} & \text { c) } 2.69+.718 \mathrm{jkVA}\end{array}$
d) 2.79 kVA
b)
lagging
g) Add a $44 \mu \mathrm{~F}$ capacitor in parallel with load
4. $\quad{ }^{\mathrm{V}} \mathrm{C}^{(\mathrm{t})}:=3 \cdot \mathrm{~V} \cdot \mathrm{e}^{\left(-5000 \frac{1}{\mathrm{sec}}\right) \cdot \mathrm{t}}+7500 \cdot \frac{\mathrm{~V}}{\mathrm{sec}} \cdot \mathrm{t} \cdot \mathrm{e}^{\left(-5000 \frac{1}{\mathrm{sec}}\right) \cdot \mathrm{t}}$
5.a) $6 \mathrm{~V} \quad$ b) 6.63 V
