Ex 1. For the circuit shown:
a) Find the transfer function $\mathrm{v}_{\mathrm{L}}$.

$$
\begin{aligned}
\mathbf{V}_{\mathbf{L}}(\mathbf{s}) & =\frac{\frac{1}{\frac{1}{\mathrm{~L} \cdot \mathrm{~s}}+\frac{1}{\mathrm{R}}}}{\frac{1}{\frac{1}{\mathrm{~L} \cdot \mathrm{~s}}+\frac{1}{\mathrm{R}}}+\frac{1}{\mathrm{C} \cdot \mathrm{~s}}} \cdot \mathbf{V}_{\mathbf{S}}(\mathbf{s}) \\
& =\frac{1}{1+\frac{1}{\mathrm{C} \cdot \mathrm{~s}} \cdot\left(\frac{1}{\mathrm{~L} \cdot \mathrm{~s}}+\frac{1}{\mathrm{R}}\right)} \cdot \mathbf{V}_{\mathbf{S}}(\mathbf{s}) \\
\mathbf{H}(\mathbf{s}) & =\frac{\mathbf{V}_{\mathbf{L}}(\mathbf{s})}{\mathbf{V}_{\mathbf{S}^{(s)}}}=\frac{\mathrm{s}^{2}}{\mathrm{~s}^{2}+\frac{1}{\mathrm{C} \cdot \mathrm{R}} \cdot \mathrm{~s}+\frac{1}{\mathrm{~L} \cdot \mathrm{C}}} \\
& =\frac{\mathrm{s}^{2}}{\mathrm{~s}^{2}+\frac{3.788 \cdot 10^{4}}{\sec } \cdot \mathrm{~s}+\frac{9.091 \cdot 10^{9}}{\sec ^{2}}}
\end{aligned}
$$

$$
=\frac{1}{1+\frac{1}{\mathrm{C} \cdot \mathrm{~s}} \cdot\left(\frac{1}{\mathrm{~L} \cdot \mathrm{~s}}+\frac{1}{\mathrm{R}}\right)} \cdot \mathbf{v} \mathbf{S}^{(\mathbf{s})}=\frac{1}{1+\frac{1}{\mathrm{C} \cdot \mathrm{~s}} \cdot \frac{1}{\mathrm{~L} \cdot \mathrm{~s}}+\frac{1}{\mathrm{C} \cdot \mathrm{~s}} \cdot \frac{1}{\mathrm{R}}} \cdot \mathbf{v}_{\mathbf{S}}(\mathbf{s}) \quad=\frac{\mathrm{s}^{2}}{\mathrm{~s}^{2}+\frac{1}{\mathrm{C} \cdot \mathrm{R}} \cdot \mathrm{~s}+\frac{1}{\mathrm{~L} \cdot \mathrm{C}}} \cdot \mathbf{v}_{\mathbf{S}}(\mathbf{s})
$$

$$
\mathrm{R}:=120 \cdot \Omega
$$

$$
\mathrm{C}:=0.22 \cdot \mu \mathrm{~F}
$$

$$
\mathrm{L}:=0.5 \cdot \mathrm{mH}
$$

$$
\frac{1}{\mathrm{C} \cdot \mathrm{R}}=3.788 \cdot 10^{4} \cdot \frac{1}{\sec } \quad \frac{1}{\mathrm{~L} \cdot \mathrm{C}}=9.091 \cdot 10^{9} \cdot \frac{1}{\sec ^{2}}
$$

b) Find the characteristic equation for this circuit. $\quad 0=s^{2}+\frac{1}{\mathrm{C} \cdot \mathrm{R}} \cdot \mathrm{s}+\frac{1}{\mathrm{~L} \cdot \mathrm{C}}=\mathrm{s}^{2}+\frac{3.788 \cdot 10^{4}}{\sec } \cdot \mathrm{~s}+\frac{9.091 \cdot 10^{9}}{\sec ^{2}}$ Just the denominator set to zero. The solutions of the characteristic equation are the "poles" of the transfer function.
c) Find the differential equation for $v_{L}$.

Cross-multiply the transfer function

$$
\begin{aligned}
\mathrm{s}^{2} \cdot \mathbf{V}_{\mathbf{S}^{(s)}} & =\left(\mathrm{s}^{2}+\frac{1}{\mathrm{C} \cdot \mathrm{R}} \cdot \mathrm{~s}+\frac{1}{\mathrm{~L} \cdot \mathrm{C}}\right) \cdot \mathbf{V}_{\mathbf{L}}(\mathbf{s}) \\
\mathrm{s}^{2} \cdot \mathbf{V}_{\mathbf{S}^{(s)}} & =\mathrm{s}^{2} \cdot \mathbf{V}_{\mathbf{L}}(\mathbf{s})+\frac{1}{\mathrm{C} \cdot \mathrm{R}} \cdot \mathrm{~s} \cdot \mathbf{V}_{\mathbf{L}}(\mathbf{s})+\frac{1}{\mathrm{~L} \cdot \mathrm{C}} \cdot \mathbf{V}_{\mathbf{L}}(\mathbf{s}) \\
\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}} \mathrm{v}^{(t)} & =\frac{\mathrm{d}^{2}}{\mathrm{dt} t^{2}} \mathrm{v}_{\mathrm{L}}(\mathrm{t})+\frac{1}{\mathrm{C} \cdot \mathrm{R}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}} \mathrm{v}_{\mathrm{L}}(\mathrm{t})+\frac{1}{\mathrm{~L} \cdot \mathrm{C}} \cdot \mathrm{v}_{\mathrm{L}}(\mathrm{t}) \\
\frac{\mathrm{d}^{2}}{\mathrm{dt} \mathrm{t}^{2}} \mathrm{v}^{(t)} & =\frac{\mathrm{d}^{2}}{\mathrm{dt} t^{2}} \mathrm{v}_{\mathrm{L}}(\mathrm{t})+\frac{3.788 \cdot 10^{4}}{\mathrm{sec}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}} \mathrm{v}_{\mathrm{L}}(\mathrm{t})+\frac{9.091 \cdot 10^{9}}{\sec ^{2}} \cdot \mathrm{v}_{\mathrm{L}}(\mathrm{t})
\end{aligned}
$$

d) What are the solutions to the characteristic equation?

$$
\begin{aligned}
& s_{1}=\frac{-3.788 \cdot 10^{4}}{2}+\frac{1}{2} \cdot \sqrt{\left(3.788 \cdot 10^{4}\right)^{2}-4 \cdot\left(9.091 \cdot 10^{9}\right)}=-1.894 \cdot 10^{4}+9.345 \cdot 10^{4} \mathrm{j} \\
& \mathrm{~s}_{2}=\frac{-3.788 \cdot 10^{4}}{2}-\frac{1}{2} \cdot \sqrt{\left(3.788 \cdot 10^{4}\right)^{2}-4 \cdot\left(9.091 \cdot 10^{9}\right)}=-1.894 \cdot 10^{4}-9.345 \cdot 10^{4} \mathrm{j}
\end{aligned}
$$

e) What type of response do you expect from this circuit?

The solutions to the characteristic equation are complex so the response will be underdamped.

2．Analysis of the circuit shown yields the characteristic equation below．The switch has been in the open position for a long time and is closed（as shown） at time $t=0$ ．Find the initial and final conditions and write the full expression for $\mathrm{i}_{\mathrm{L}}(\mathrm{t})$ ，including all the constants that you find．Don＇t let the odd position of the switch throw you，just use it to find your initial conditions．
