## Double Integrator

A very common system and a difficult design problem.

$$
\begin{aligned}
& \text { It's Newton's fault: } \quad F=m \cdot a=m \cdot \frac{d^{2}}{d t^{2}} x \\
& \text { Same for angular motion: } T=J \cdot \alpha=J \cdot \frac{d^{2}}{d t^{2}} \theta
\end{aligned}
$$

$$
\begin{aligned}
\mathbf{X}(\mathrm{s})= & \mathbf{F}(\mathrm{s}) \cdot \frac{1}{\mathrm{~m} \cdot \mathrm{~s}^{2}} \\
& \& \quad \mathbf{P}(\mathrm{~s})=\frac{1}{\mathrm{~m} \cdot \mathrm{~s}^{2}}
\end{aligned}
$$

This problem arises anytime force is the input and position is the output.

Force is the ONLY way to get the motion of any object to change, so yes, this is a common problem.

In the Inverted Pendulum lab, the movement of the base is simplified to a first-order system to avoid the difficulties that come from this very issue.

The example used in section 5.3 .9 is a VERY REAL example.

If the angle is always 180 , then wouldn't positive feedback work?

Positive feedback is similar to negative gain, which makes root-locus rules work backwards, here the real-axis rule:
Given the issues with a PD (the differentiator). lets use a Lead controller.

$$
\mid \quad \text { CL poles } \pm \sqrt{\mathrm{K} \cdot \mathrm{k}_{\mathrm{p}}}
$$

## Lead controller

See section 5.3.9

$$
\mathbf{C}(\mathrm{s})=\mathrm{k}_{\mathrm{c}} \cdot \frac{\mathrm{~s}+\mathrm{b}}{\mathrm{~s}+\mathrm{a}}
$$

Put the two together,

$$
\mathbf{G}(\mathrm{s})=\mathrm{k}_{\mathrm{c}} \cdot \frac{\mathrm{~s}+\mathrm{b} \cdot \mathrm{~b}}{\mathrm{~s}+\mathrm{a}} \cdot \frac{\mathrm{k}_{\mathrm{p}}}{\mathrm{~s}^{2}}=\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot \frac{\mathrm{~s}+\mathrm{b}}{\mathrm{~s}^{2} \cdot(\mathrm{~s}+\mathrm{a})}
$$

Bode plots (numbers are representative)

But now the maximum phase angle difference from 180 doesn't occur where the magnitude crosses 0dB.

This problem is resolved in the math shown in the book, which makes:

$$
\begin{aligned}
\omega_{\mathrm{c}} & =\omega_{\mathrm{p}} \\
\text { freq. of maximum } & =\text { freq. where } \mathbf{G}(\mathrm{s}) \\
\text { phase difference } & \text { crosses } 0 \mathrm{~dB} .
\end{aligned}
$$

## The Bottom Line

I've combined information from the table in section 5.3.7 with the table in section 5.3.9.

1. Select your $\mathrm{a} / \mathrm{b}$ ratio, use this ratio as a single number in following equations.

2. Use eq. 5.75 to relate $\omega_{\mathrm{c}}$ to $\mathrm{k}_{\mathrm{p}}$ and $\mathrm{k}_{\mathrm{c}} \cdot \quad \frac{\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}}}{\omega_{\mathrm{c}}{ }^{2}} \cdot \sqrt{\frac{\mathrm{~b}}{\mathrm{a}}}=1 \quad$ OR, rearranged: $\omega_{\mathrm{p}}=\omega_{\mathrm{c}}=\sqrt{\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot \sqrt{\frac{b}{a}}}$ Note: $\frac{b}{a}=\frac{1}{\left(\frac{a}{b}\right)}$
Depending on your knowns and unknowns, other rearrangements may be useful:

$$
\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}}=\omega_{\mathrm{c}}^{2} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}} \quad \mathrm{k}_{\mathrm{p}}=\frac{\omega_{\mathrm{c}}^{2}}{\mathrm{k}_{\mathrm{c}}} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}} \quad \mathrm{k}_{\mathrm{c}}=\frac{\omega_{\mathrm{c}}^{2}}{\mathrm{k}_{\mathrm{p}}} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}}
$$

To get some answers, I arbitrarily used: $\quad \omega_{\mathrm{c}}:=10 \quad \mathrm{k}_{\mathrm{p}}:=1 \quad$ and found $\mathrm{k}_{\mathrm{c}}$ from the eq. above
$\begin{array}{rlr}\text { 3. Find: } \quad \begin{aligned} a & =\omega_{c} \cdot \sqrt{\frac{a}{b}}=\omega_{p} \cdot \sqrt{\frac{a}{b}}\end{aligned} \quad b=\omega_{c} \cdot \sqrt{\frac{b}{a}}=\omega_{p} \cdot \sqrt{\frac{b}{a}} \\ & \text { the pole location of } \mathbf{C}(\mathrm{s}) & \text { the zero location of } \mathbf{C}(\mathrm{s})\end{array}$

Problem 5.14 in the text shows that the approximations of overshoot given in the table above are not very good (off by about a factor of 2), but, those predicted by the second-order approximation are even worse (b/c of zero close to origin).

## Why Bode Plots?

1. Provides a method to find the approximate transfer function as used in the Flexible Beam lab.
2. Terms GM and PM are in wide use and you need to know what they mean.
3. Sometimes used for design method as in the Flexible Beam lab.
a) Consider the lead controller for the double integrator. For the design that makes the crossover frequency equal to $\omega_{\mathrm{C}}$, obtain the polynomial that specifies the closed-loop poles (as a function of $\mathrm{a} / \mathrm{b}$ and $\omega_{\mathrm{C}}$ ). Show that one closed-loop pole is at $\mathrm{s}=-\omega_{\mathrm{C}}$ no matter what $\mathrm{a} / \mathrm{b}$ is.

$$
\mathbf{G}_{\mathbf{c}}(\mathrm{s})=\mathbf{P}(\mathrm{s}) \cdot \mathbf{C}(\mathrm{s})=\frac{\mathrm{k}_{\mathrm{p}}}{\mathrm{~s}^{2}} \cdot \mathrm{k}_{\mathrm{c}} \cdot \frac{\mathrm{~s}+\mathrm{b}}{\mathrm{~s}+\mathrm{a}}
$$

Denominator of the closed-loop transfer function:

$$
\begin{aligned}
\mathbf{D}_{\mathbf{G}}+\mathbf{N}_{\mathbf{G}} & =\mathrm{s}^{2} \cdot(\mathrm{~s}+\mathrm{a})+\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b}) \\
& =\mathrm{s}^{3}+\mathrm{a} \cdot \mathrm{~s}^{2}+\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})=0
\end{aligned}
$$

$$
\text { Substitute: } \quad a=\omega_{c} \cdot \sqrt{\frac{a}{b}} \quad b=\omega_{c} \cdot \sqrt{\frac{b}{a}} \quad k_{c}=\frac{\omega_{c}^{2}}{k_{p}} \cdot \sqrt{\frac{a}{b}} \quad \text { eq. } 5.70 \text { in book. }
$$

$$
0=s^{3}+\omega_{c} \cdot \sqrt{\frac{a}{b}} \cdot s^{2}+k_{p} \cdot\left(\frac{\omega_{c}{ }^{2}}{k_{p}} \cdot \sqrt{\frac{a}{b}}\right) \cdot\left(s+\omega_{c} \cdot \sqrt{\frac{b}{a}}\right) \quad=s^{3}+\omega_{c} \cdot \sqrt{\frac{a}{b}} \cdot s^{2}+\omega_{c}{ }^{2} \cdot \sqrt{\frac{a}{b}} \cdot s+\omega_{c}{ }^{2} \cdot \sqrt{\frac{a}{b}} \cdot \omega_{c} \cdot \sqrt{\frac{b}{a}}
$$

$$
=s^{3}+\omega_{c} \cdot \sqrt{\frac{a}{b}} \cdot s^{2}+\omega_{c}{ }^{2} \cdot \sqrt{\frac{a}{b}} \cdot s+\omega_{c}{ }^{3} \quad s^{2}+\omega_{c} \cdot\left(\sqrt{\frac{a}{b}}-1\right) \cdot s+\omega_{c}{ }^{2}
$$

$$
\text { Polynomial division: } \quad s+\omega_{c} \mathrm{~s}^{3}+\omega_{c} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}} \cdot \mathrm{~s}^{2}+\omega_{\mathrm{c}}{ }^{2} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}} \cdot \mathrm{~s}+\omega_{\mathrm{c}}{ }^{3}
$$

$$
-s^{3}-\omega_{c} \cdot s^{2}
$$

$$
\left(\omega_{\mathrm{c}} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}}-\omega_{\mathrm{c}}\right) \cdot \mathrm{s}^{2}+\omega_{\mathrm{c}}{ }^{2} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}} \cdot \mathrm{~s}+\omega_{\mathrm{c}}{ }^{3}
$$

$$
-\omega_{c} \cdot\left(\sqrt{\frac{a}{b}}-1\right) \cdot s^{2}-\omega_{c}{ }^{2} \cdot\left(\sqrt{\frac{a}{b}}-1\right) \cdot s
$$

$$
\omega_{c}^{2} \cdot s+\omega_{c}^{3}
$$

$$
\omega_{c}^{2} \cdot s+\omega_{c}^{3}
$$

b) Compute the other closed-loop poles, as functions of $\omega_{\mathrm{C}}$, when $\mathrm{a} / \mathrm{b}=5.83,9$, and 13.9 .
The "other" roots are the roots of the quotient. $\quad 0=\mathrm{s}^{2}+\omega_{\mathrm{c}} \cdot\left(\sqrt{\frac{\mathrm{a}}{\mathrm{b}}-1}\right) \cdot \mathrm{s}+\omega_{\mathrm{c}}{ }^{2}$

$$
\begin{aligned}
& \begin{array}{l}
\mathrm{a} / \mathrm{b}=5.83 \quad\left(\frac{\mathrm{a}}{\mathrm{~b}}-1=(\sqrt{5.83}-1)=1.415\right. \\
\mathrm{s}=\left[\frac{-\omega_{\mathrm{c}} \cdot(\sqrt{5.83}-1)}{2}+\frac{1}{2} \cdot \sqrt{\left.\left[\omega_{\mathrm{c}} \cdot(\sqrt{5.83}-1)\right]^{2}-4 \cdot \omega_{c}{ }^{2}\right]=\frac{-\omega_{\mathrm{c}} \cdot(\sqrt{5.83}-1)}{2}+\frac{1}{2} \cdot \omega_{c} \cdot \sqrt{(\sqrt{5.83}-1)^{2}-4}}\right.
\end{array} \\
& =\frac{-(\sqrt{5.83}-1)}{2}+\frac{1}{2} \cdot \sqrt{(\sqrt{5.83}-1)^{2}-4}=-0.707+0.707 \mathrm{j} \quad(-0.7071-0.7071 \cdot \mathrm{j}) \cdot \omega_{\mathrm{c}} \quad \& \quad(-0.7071+0.7071 \cdot \mathrm{j}) \cdot \omega_{\mathrm{c}} \\
& a / b=9 \quad \frac{-(\sqrt{9}-1)}{2}=-1 \quad \frac{\sqrt{(\sqrt{9}-1)^{2}-4}}{2}=0 \quad-\omega_{c} \quad \& \quad-\omega_{c} \\
& \mathrm{a} / \mathrm{b}=13.9 \quad \frac{-(\sqrt{13.9}-1)}{2}+\frac{1}{2} \cdot \sqrt{(\sqrt{13.9}-1)^{2}-4}=-0.436 \\
& \text { ECE } 3510 \text { Bode Design p4 } \\
& \begin{aligned}
\frac{-(\sqrt{13.9}-1)}{2}-\frac{1}{2} \cdot \sqrt{(\sqrt{13.9}-1)^{2}-4} & =-2.292 \\
\& & -2.292 \cdot \omega_{\mathrm{c}}
\end{aligned}
\end{aligned}
$$

## ECE 3510 Bode Design p5

For plots: $\mathrm{t}:=0.01,0.02 . .1 .5$
c) Use Matlab SISO or other software of your choice to confirm the results of part c) and the \% overshoot figures expected from the phase margins by the second-order approximation.
( $20 . \% \quad 14 . \% ~ 9.5 \% ~) ~$

$$
\mathbf{P}(\mathrm{s}) \cdot \mathbf{C}(\mathrm{s})=\frac{\mathrm{k}_{\mathrm{p}}}{\mathrm{~s}^{2}} \cdot \mathrm{k}_{\mathrm{c}} \cdot \frac{\mathrm{~s}+\mathrm{b}}{\mathrm{~s}+\mathrm{a}} \quad \mathrm{H}(\mathrm{~s})=\frac{\mathrm{P}(\mathrm{~s}) \cdot \mathrm{C}(\mathrm{~s})}{1+\mathrm{P}(\mathrm{~s}) \cdot \mathrm{C}(\mathrm{~s})} \quad=\frac{\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})}{(\mathrm{s}+\mathrm{a}) \cdot \mathrm{s}^{2}+\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})}
$$

$$
\mathbf{X}(s)=\frac{1}{s} \text { the unit step function }
$$

$$
\mathbf{Y}(\mathrm{s})=\mathbf{X}(\mathrm{s}) \cdot \mathbf{H}(\mathrm{s})=\frac{1}{\mathrm{~s}} \cdot \frac{\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})}{(\mathrm{s}+\mathrm{a}) \cdot \mathrm{s}^{2}+\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})}=\frac{1}{\mathrm{~s}} \cdot \frac{\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})}{(\mathrm{s}+\mathrm{a}) \cdot \mathrm{s}^{2}+\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})}
$$

$$
=\frac{1}{\mathrm{~s}} \cdot \frac{\mathrm{k}_{\mathrm{p}} \cdot \mathrm{k}_{\mathrm{c}} \cdot(\mathrm{~s}+\mathrm{b})}{\left(\mathrm{s}+\omega_{\mathrm{c}}\right) \cdot\left[\mathrm{s}^{2}+\omega_{\mathrm{c}} \cdot\left(\sqrt{\left.\left.\frac{\mathrm{a}}{\mathrm{~b}}-1\right) \cdot \mathrm{~s}+\omega_{\mathrm{c}}^{2}\right]}\right.\right.}
$$

I will set: $\quad \omega_{\mathrm{c}}:=10 \quad \mathrm{k}_{\mathrm{p}}:=1$
First case: $\frac{a}{b}=\mathrm{a} \_\mathrm{b}:=5.83 \quad \mathrm{a}=\omega_{c} \cdot \sqrt{\frac{a}{b}}=\mathrm{a}:=\omega_{c} \cdot \sqrt{\mathrm{a}_{-} \mathrm{b}} \quad \mathrm{a}=24.145$

$$
\begin{aligned}
& \mathrm{b}=\frac{\omega_{\mathrm{c}}}{\sqrt{\frac{\mathrm{a}}{\mathrm{~b}}}}=\mathrm{b}:=\frac{\omega_{\mathrm{c}}}{\sqrt{\mathrm{a} \_\mathrm{b}}} \quad \mathrm{~b}=4.142 \\
& \mathrm{k}_{\mathrm{c}}=\frac{\omega_{\mathrm{c}}^{2}}{\mathrm{k}_{\mathrm{p}}} \cdot \sqrt{\frac{\mathrm{a}}{\mathrm{~b}}}=\mathrm{k}_{\mathrm{c}}:=\frac{\omega_{\mathrm{c}}^{2}}{\mathrm{k}_{\mathrm{p}}} \cdot \sqrt{\mathrm{a}_{-} \mathrm{b}} \quad \mathrm{k}_{\mathrm{c}}=241.454
\end{aligned}
$$

$$
\mathbf{G}_{\mathbf{c}^{(\mathrm{s}}}=\frac{\mathrm{k}_{\mathrm{p}}}{\mathrm{~s}^{2}} \cdot \mathrm{k}_{\mathrm{c}} \cdot \frac{\mathrm{~s}+\mathrm{b}}{\mathrm{~s}+\mathrm{a}}=\frac{241.454 \cdot(\mathrm{~s}+4.142)}{\mathrm{s}^{2} \cdot(\mathrm{~s}+24.145)}
$$

Expected overshoot
Expected overshoot
$\zeta:=\frac{45 \cdot \mathrm{deg}}{100 \cdot \mathrm{deg}} \quad \zeta=0.45 \quad 100 \cdot \% \cdot \mathrm{e}^{\frac{-\zeta \cdot \pi}{\sqrt{1-\zeta^{2}}}=20.535 \cdot \%}$

## Second case:

$$
\begin{aligned}
& \begin{array}{ll}
\frac{\mathrm{a}}{\mathrm{~b}}=\mathrm{a} \_\mathrm{b}:=9 & \mathrm{a}:=\omega_{\mathrm{c}} \cdot \sqrt{\mathrm{a} \_\mathrm{b}} \\
\mathrm{a}=30
\end{array} \quad \mathrm{~b}:=\frac{\omega_{\mathrm{c}}}{\sqrt{\mathrm{a} \_\mathrm{b}}} \quad \mathrm{~b}=3.333 \quad \mathrm{k}_{\mathrm{c}}:=\frac{\omega_{\mathrm{c}}{ }^{2}}{\mathrm{k}_{\mathrm{p}}} \cdot \sqrt{\mathrm{a} \_\mathrm{b}} \quad \mathrm{k}_{\mathrm{c}}=300 \\
& \mathbf{G}_{\mathbf{c}^{(s)}}=\frac{300 \cdot\left(\mathrm{~s}+\frac{10}{3}\right)}{\mathrm{s}^{2} \cdot(\mathrm{~s}+30)} \\
& \text { Root Locus with gain = } 1 \\
& \text { CL pole Locations } \\
& \text { at red squares: } \\
& 1 \\
& \text { Expected overshoot } \\
& \zeta:=\frac{53.1 \cdot \operatorname{deg}}{100 \cdot \operatorname{deg}} \quad \zeta=0.531 \quad 100 \cdot \% \cdot e^{\sqrt{1-\zeta^{2}}}=13.964 \cdot \% \\
& \% \text { overshoot } \simeq 27 . \%
\end{aligned}
$$

$\mathrm{b}=2.682$
$\mathrm{k}_{\mathrm{c}}:=\frac{\omega_{\mathrm{c}}{ }^{2}}{\mathrm{k}_{\mathrm{p}}} \cdot \sqrt{\mathrm{a} \_\mathrm{b}} \quad \mathrm{k}_{\mathrm{c}}=372.827$

Expected overshoot
$\zeta:=\frac{60 \cdot \mathrm{deg}}{100 \cdot \mathrm{deg}} \quad \zeta=0.6 \quad 100 \cdot \% \cdot \mathrm{e}^{\sqrt{\sqrt{1-\zeta^{2}}}=9.478 \cdot \%}$

$\%$ overshoot $\simeq 21 . \%$
Actual overshoots are much larger than expected by the table above, but, overshoots predicted by the second-order approximation are even worse (b/c of zero close to origin).

Let's find the transfer function of this circuit.

$$
\begin{aligned}
& \mathbf{H}(\mathrm{s})=\text { ? } \\
& \mathbf{H}(\mathrm{s})=\frac{\mathbf{V}_{\mathbf{0}}(\mathrm{s})}{\mathbf{V}_{\mathbf{i}}(\mathrm{s})}=\frac{\overline{\frac{1}{\mathrm{R}_{2}}+\mathrm{C} \cdot \mathrm{~s}}}{\mathrm{R}_{1}+\mathrm{L} \cdot \mathrm{~s}+\frac{1}{\frac{1}{\mathrm{R}_{2}}+\mathrm{C} \cdot \mathrm{~s}}} \quad \frac{\frac{1}{\mathrm{R}_{2}}+\mathrm{C} \cdot \mathrm{~s}}{\frac{1}{\mathrm{R}_{2}}+\mathrm{C} \cdot \mathrm{~s}} \\
& =\frac{1}{\mathrm{R}_{1} \cdot\left(\frac{1}{\mathrm{R}_{2}}+\mathrm{C} \cdot \mathrm{~s}\right)+\mathrm{L} \cdot \mathrm{~s} \cdot\left(\frac{1}{\mathrm{R}_{2}}+\mathrm{C} \cdot \mathrm{~s}\right)+1} \\
& =\frac{1}{\frac{\mathrm{R}_{1}}{\mathrm{R}_{2}}+\mathrm{R}_{1} \cdot \mathrm{C} \cdot \mathrm{~s}+\frac{\mathrm{L} \cdot \mathrm{~s}}{\mathrm{R}_{2}}+\mathrm{L} \cdot \mathrm{~s} \cdot \mathrm{C} \cdot \mathrm{~s}+1} \quad \frac{\frac{1}{\mathrm{~L} \cdot \mathrm{C}}}{\frac{1}{\mathrm{~L} \cdot \mathrm{C}}} \\
& =\frac{\frac{1}{\mathrm{~L} \cdot \mathrm{C}}}{\mathrm{~s}^{2}+\left(\frac{\mathrm{R}_{1}}{\mathrm{~L}}+\frac{1}{\mathrm{R}_{2} \cdot \mathrm{C}}\right) \cdot \mathrm{s}+\left(1+\frac{\mathrm{R}_{1}}{\mathrm{R}_{2}}\right) \cdot \frac{1}{\mathrm{~L} \cdot \mathrm{C}}}
\end{aligned}
$$

## Input Impedance

What load does this circuit place on the source of $\mathbf{V}_{\mathbf{i}}$ ?

$$
\begin{aligned}
& \mathbf{Z}_{\mathbf{i n}}(\mathrm{s})=\mathrm{R}_{1}+\mathrm{L} \cdot \mathrm{~s}+\frac{1}{\frac{1}{\mathrm{R}_{2}}+\mathrm{C} \cdot \mathrm{~s}} \quad \text { OR, if this circuit is followed by another circuit with } \quad \mathbf{Z}_{\mathbf{i n 2}}(\mathrm{s}) \text {, then, } \\
& \text { Usually, the higher the input impedance, the better. }
\end{aligned} \mathbf{Z}_{\mathbf{i n}}(\mathrm{s})=\mathrm{R}_{1}+\mathrm{L} \cdot \mathrm{~s}+\frac{1}{\frac{1}{R_{2}}+\mathrm{C} \cdot \mathrm{~s}+\frac{1}{\mathbf{Z}_{\mathbf{i n 2}}(\mathrm{s})}}
$$

## Output Impedance

Output Impedance is just like the Thévenin Resistance
Thévevin Equivalent Circuit

## Thévenin equivalent

To calculate a circuit's Thévenin equivalent:

1) Remove the load and calculate the open-circuit voltage where the load used to be.

This is the Thévenin voltage $\left(\mathrm{V}_{\mathrm{Th}}\right)$.
2) Zero all the sources.
(To zero a voltage source, replace it with a short. To zero a current source, replace it with an open.)
3) Compute the total resistance between the load terminals.
(DO NOT include the load in this resistance.) This is the Thévenin source resistance $\left(\mathrm{R}_{\text {Th }}\right)$.
4) Draw the Thévenin equivalent circuit and add your values.

ECE $3510 \quad Z_{\text {in }} Z_{\text {out }}$ notes p 1

## Ex 1 Find the Thévenin equivalent:

To find a circuit's Thévenin equivalent:

1) Remove the load and calculate the open-circuit voltage where the load used to be. ${ }^{V_{S}}=20 \cdot \mathrm{~V}$ This is the Thévenin voltage $\left(\mathrm{V}_{\mathrm{Th}}\right)$.

2) Zero all the sources.
(To zero a voltage source, replace it with a short. To zero a current source, replace it with an open.)
3) Compute the total resistance between the load terminals. (DO NOT include the load in this resistance.) This is the Thévenin source resistance ( $\mathrm{R}_{\mathrm{Th}}$ ).

Find the Thevenin resistance:
Zero the source

$$
\mathrm{R}_{\mathrm{Th}}=30 \cdot \Omega
$$

4) Draw the Thévenin equivalent circuit and add your values.

Thevenin equivalent circuit: If the load were reconnected:

## Output Impedance

OR, if this circuit is preceded by another circuit with $\quad \mathbf{Z}_{\text {out }^{(s)}}{ }^{(s)}$, then, $\quad \mathbf{Z}_{\text {out }^{(s)}}{ }^{(s)}=\frac{1}{\frac{1}{\mathbf{Z}_{\text {out0 }}}+\frac{1}{R_{1}+L \cdot s}+\frac{1}{R_{2}}+C \cdot s}$
Usually, the lower the output impedance, the better
ECE $3510 \quad Z_{\text {in }} Z_{\text {out }}$ notes p2

## Amplifier Compensation \& Bandwidth Extension (Especially, Op Amps)

Recall from previous classes that op-amps are used with lots of negative feedback. In homework 4, you showed that common op-amp circuits could be looked at as feedback loops.

$$
\frac{\mathrm{V}_{\mathrm{o}}}{\mathrm{~V}_{\text {in }}}=\frac{\mathrm{A}}{1+\mathrm{A} \cdot \mathrm{~B}}=\frac{\mathrm{G}}{1+\frac{\mathrm{R}_{1}}{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}} \cdot \mathrm{G}}=\frac{\mathrm{G} \cdot\left(\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}\right)}{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}+\mathrm{R}_{1} \cdot \mathrm{G}}=\frac{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}}{\frac{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}}{\mathrm{G}}+\mathrm{R}_{1}} \simeq \frac{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}}{0+\mathrm{R}_{1}}=1+\frac{\mathrm{R}_{\mathrm{f}}}{\mathrm{R}_{1}}
$$

AND

$\frac{V_{o}}{V_{\text {in }}}=-\frac{R_{f}}{R_{\text {in }}+R_{f}} \cdot \frac{A}{1+A \cdot B}=-\frac{R_{f}}{R_{\text {in }}+R_{f}} \cdot \frac{G}{1+\frac{R_{i n}}{R_{i n}+R_{f}} \cdot G}=-\frac{R_{f} G}{R_{i n}+R_{f}+R_{i n} \cdot G}=-\frac{R_{f}}{R_{i n}+R_{f}} \frac{R_{i n}}{G}+R_{\text {in }}-\frac{R_{f}}{0+R_{\text {in }}}=-\frac{R_{f}}{R_{\text {in }}}$

But, op-amps are made of real circuitry and therefore have a little delay. Just a delay of: $\mathrm{D}:=1 \cdot \mu \mathrm{~s}$
Would result phase angle plots like those below. Serious problems above 500 kHz .

To make sure that op-amp circuits remain stable with feedback, they are compensated with a low-frequency pole so that the gain is less than 0 dB where the phase angle falls off to $-180^{\circ}$.

## ECE 3510 Amplifier Feedback p2

Typical op-amp compensation would look like this for an op-amp with a gain of 100 k and $\mathrm{D}=1 \mu \mathrm{~s}$.

$$
\mathrm{G}:=100000
$$

Adequate compensation could be a pole at $2 \mathrm{~Hz}(4 \pi \mathrm{rad} / \mathrm{sec})$.
Op-amp transfer function: $\frac{\mathrm{G} \cdot 4 \cdot \pi}{\mathrm{~s}+4 \cdot \pi}$
$\mathrm{G} \cdot 2 \cdot \mathrm{~Hz}$ is the gain-bandwidth product (GBW).
(in Hz)
For the noninverting amp:

$$
\frac{\mathrm{V}_{\mathrm{o}}}{\mathrm{~V}_{\text {in }}}=\frac{\frac{\mathrm{G} \cdot 4 \cdot \pi}{\mathrm{~s}+2}}{1+\frac{\mathrm{R}_{1}}{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}} \cdot \frac{\mathrm{G} \cdot 4 \cdot \pi}{\mathrm{~s}+4 \cdot \pi}}
$$

For the inverting amp:

$$
=\frac{\mathrm{G} \cdot 4 \cdot \pi}{\mathrm{~s}+4 \cdot \pi+\frac{\mathrm{R}_{1}}{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}} \cdot \mathrm{G} \cdot 4 \cdot \pi} \text { new pole is at: } 4 \cdot \pi+\frac{\mathrm{R}_{1}}{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}} \cdot \mathrm{G} \cdot 4 \cdot \pi \underset{\sim}{\frac{\mathrm{R}_{1}}{\mathrm{R}_{1}+\mathrm{R}_{\mathrm{f}}} \cdot \mathrm{G} \cdot 4 \cdot \pi \mathrm{rad} / \mathrm{sec}}
$$

$$
\begin{array}{r}
\frac{\mathrm{V}_{\mathrm{o}}}{\mathrm{~V}_{\mathrm{in}}}=-\frac{\mathrm{R}_{\mathrm{f}}}{\mathrm{R}_{\text {in }}+\mathrm{R}_{\mathrm{f}}} \cdot \frac{\frac{\mathrm{G} \cdot 4 \cdot \pi}{\mathrm{~s}+4 \cdot \pi}}{1+\frac{\mathrm{R}_{\mathrm{in}}}{\mathrm{R}_{\mathrm{in}}+\mathrm{R}_{\mathrm{f}}} \cdot \frac{\mathrm{G} \cdot 4 \cdot \pi}{\mathrm{~s}+4 \cdot \pi}}=-\frac{\mathrm{R}_{\mathrm{f}}}{\mathrm{R}_{\mathrm{in}}+\mathrm{R}_{\mathrm{f}}} \cdot \frac{\mathrm{G} \cdot 4 \cdot \pi}{\mathrm{~s}+4 \cdot \pi+\frac{\mathrm{R}_{\mathrm{in}}}{\mathrm{R}_{\mathrm{in}}+\mathrm{R}_{\mathrm{f}}} \cdot \mathrm{G} \cdot 4 \cdot \pi} \\
\text { new pole is at: } 4 \cdot \pi+\frac{\mathrm{R}_{\mathrm{in}}}{\mathrm{R}_{\mathrm{in}}+\mathrm{R}_{\mathrm{f}}} \cdot \mathrm{G} \cdot(4 \cdot \pi) \simeq \frac{\mathrm{R}_{\mathrm{in}}}{\mathrm{R}_{\mathrm{in}}+\mathrm{R}_{\mathrm{f}}} \cdot \mathrm{G} \cdot(4 \cdot \pi) \mathrm{rad} / \mathrm{sec} \quad=\frac{\mathrm{GBW}}{\text { Closed-loop gain }} \tag{inHz}
\end{array}
$$

The pole is also the 3 dB roll-off point of the amplifier, as long as it's just a single pole.

## And, The upshot is:

If your op-amp circuit has a closed-loop gain of " g ", then the bandwidth should be about:

Closed-loop bandwidth: $\frac{\text { GBW }}{\mathrm{g}}$ (in Hz )

Example closed-loop frequency responses: for a closed-loop gain of 500 :
( $54 \cdot \mathrm{~dB}$ )
for a closed-loop gain of 20 : ( $26 \cdot \mathrm{~dB}$ )

If you want a higher frequency response, either buy a better op-amp, with a higher gain-bandwidth product, or use more stages. However, if you use two stages with the same the 3 dB roll-off point, be aware that the overall roll-off will be 6 dB at that frequency and that the 3 dB roll-off point will be lower by about $36 \%$.
And about $50 \%$ lower for three stages with same 3 dB roll-off point.

## Effects of Negative Feedback on Linear Amplifiers

In general, you trade gain for other improvements, like bandwidth.
Gain
Closed-loop gain (Gain with feedback) $=\mathrm{A}_{\mathrm{f}}=\frac{\mathrm{A}_{\mathrm{o}}}{1+\mathrm{A}_{\mathrm{o}} \cdot \mathrm{B}}=\frac{\text { Open-loop gain }}{\text { Amount of feedback }}$
If $A_{o} \cdot B$ is significantly $>1$, then: $\quad A_{f} \simeq \frac{1}{B}$
$B=$ the feedback factor, generally less than 1 , often a lot less.
This is a big difference between the control systems we have been studying and feedback used with amplifiers. Control systems generally use feedback closer to 1 .

Gain is stabilized, even if the the open-loop gain $\left(\mathrm{A}_{\mathrm{o}}\right)$ in not consistent.
Possible inconsistencies:
Gain may be be inconsistent from one device to the next due to manufacturing differences.
Gain may be be inconsistent over a range of signal frequencies, as seen above..
Gain may be be inconsistent over a range of signal amplitudes and/or output magnitudes (nonlinear gain).

## Bandwidth extension

The high-frequency side of this has already been illustrated as it pertains to op amps, but it also works for low frequencies.
in general: If the open-loop amplifier has

$\mathrm{A}_{\mathrm{o}}=$ Midband gain
the following transfer function: $\left(s+\omega_{L}\right) \cdot\left(1+\frac{\mathrm{s}}{\omega_{\mathrm{H}}}\right)$
$\omega_{\mathrm{L}}=$ Low-frequency 3 dB roll-off point
$\omega_{\mathrm{H}}=$ High-frequency 3 dB roll-off point
With feedback

$$
\begin{aligned}
& \text { High-frequency } 3 \mathrm{~dB} \text { roll-off point }=\omega_{\mathrm{Hf}}=\omega_{\mathrm{H}} \cdot\left(1+\mathrm{A}_{\mathrm{o}} \cdot \mathrm{~B}\right) \\
& \text { Low-frequency } 3 \mathrm{~dB} \text { roll-off point }=\omega_{\mathrm{Lf}}=\frac{\omega_{\mathrm{L}}}{1+\mathrm{A}_{\mathrm{o}} \cdot \mathrm{~B}} \quad \mathrm{f}_{\mathrm{Hf}}=\mathrm{f}_{\mathrm{H}} \cdot\left(1+\mathrm{A}_{\mathrm{o}} \cdot \mathrm{~B}\right) \\
& \text { OR } \quad \mathrm{f}_{\mathrm{Lf}}=\frac{\mathrm{f}_{\mathrm{L}}}{1+\mathrm{A}_{\mathrm{o}} \cdot \mathrm{~B}}
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{A}_{\mathrm{f}}=\text { Midband gain } \\
& \omega_{\mathrm{Lf}}=\text { Low-frequency } 3 \mathrm{~dB} \text { roll-off point } \\
& \omega_{\mathrm{Hf}}=\text { High-frequency } 3 \mathrm{~dB} \text { roll-off point }
\end{aligned}
$$

## Noise Reduction (increase Signal to Noise ( $\mathbf{S} / \mathbf{N}$ ) ratio)

Unwanted additions to the signal, like hiss or hum, are called noise. Every amplifier stage adds some noise.
Feedback can reduce noise as long as it isn't added in at the input to the first stage, where it looks just like a part of the signal. The later in the amplifier the noise is added, the more effective feedback is at reducing it.

## Reduce Signal Distortion (Total Harmonic Distortion, THD)

Signal distortion is usually caused by either nonlinear gain, like those shown earlier, or by the frequency response limitations which distort the relationship of the fundamental and harmonics of a signal. Noise is also a form of distortion.

Distortion caused by nonlinear gain

Distortion caused by limited frequency response

Stabilizing the gain also makes the gain more linear. Extending the bandwidth lets more harmonics through. Feedback improves both.

## Bias Stabilization

This is type of feedback is part of an individual stage of an amplifier, rather than around the entire amplifier, so, in a way, it doesn't fit the discussion here. The discrete devices we use for amplification generally need to be biased into a conduction state before a signal is applied which creates current and voltage variations about the bias points.
(Exceptions are class B and class D power amplifiers.)

The purpose of $R_{E}, R_{S}$ and $R_{C}$ in each of these amplifier stages is the same. They provide negative feedback so as to stabilize the current flowing down though the device. The DC component of that current is the bias current. They all affect the signal as well, increasing the input impedance, reducing distortion and limiting the gain to about $\mathrm{R}_{\mathrm{C}} / \mathrm{R}_{\mathrm{E}}, \mathrm{R}_{\mathrm{D}} / \mathrm{R}_{\mathrm{S}}$, and $\mathrm{R}_{\mathrm{P}} / \mathrm{R}_{\mathrm{C}}$ respectively. Placing a bypass capacitor in parallel with this resistor can remove the feedback at signal frequencies, but you loose the other benefits. Partial bypass can be a compromise.

ECE 3510 Amplifier Feedback p4

Bypass

Partial bypass

## Output Impedance

For an amplifier with voltage feedback, the output impedance is reduced. By "voltage feedback", I mean that the feedback signal is a sample of the output voltage. Also called "shunt" feedback. (See the four feedback topologies.)

For an amplifier with current feedback, the output impedance is increased. By "current feedback", I mean that the feedback signal is a sample of the output current. Also called "series" feedback. (See the four feedback topologies.)

## Input Impedance

For an amplifier with voltage mixing, the input impedance is increased. By "voltage mixing", I mean that the feedback signal is voltage combined in series with the input voltage. Also called "series" mixing. (See the four feedback topologies.)

Ideally: $\mathrm{Z}_{\mathrm{in}} \cdot\left(1+\mathrm{A}_{\mathrm{o}} \cdot \mathrm{B}\right)=\mathrm{Z}_{\text {inf }}$
If the desired input of your amp is voltage, then a higher input impedance is exactly what you want.

For an amplifier with current mixing, the input impedance is reduced. By "current mixing", I mean that the feedback signal is a current reducing the input current. Also called "shunt" mixing. (See the four feedback topologies.)

Assumptions to get ideal answers:

1. Feedback networks have ideal input and output resistances.
2. Loads are ideal for the type of output. $\quad R_{L}=\infty$ for voltage outputs. $\quad R_{L}=0$ for current outputs.

Otherwise improvements in output and input impedances will be less than ideal.

## To Find the Input Impedance

1. Draw out the full innards of all the boxes in the appropriate topology shown below, including all the non-ideal characteristics you want to include.
2. For topologies a) and d), below, connect nothing to the output, unless you want to see the the effect of the load on the input impedance. Even then, it's easier to work it out without a load first and then add the effect of the load in later.

For topologies b) and c), below, connect a short to the output, unless you want to see the the effect of the load. Again, it's easier to work without a load first.
3. For topologies a) and c), below, connect an ideal voltage source to the input and find the input current. Use whatever circuit analysis methods you like.

For topologies b) and d), below, connect an ideal current source to the input and find the input voltage. Use whatever circuit analysis methods you like.
4.

$$
\mathrm{Z}_{\mathrm{inf}}=\frac{\mathrm{V}_{\mathrm{in}}}{\mathrm{i}_{\mathrm{in}}}
$$

## To Find the Output Impedance

1. Draw out the full innards of all the boxes in the appropriate topology shown below, including all the non-ideal characteristics you want to include.
2. For topologies a) and c), below, connect a short at the input.

For topologies b) and d), below, connect nothing to the input.
3. For topologies a) and d), below, connect an ideal voltage source to the output and find the current flowing back into the output.

For topologies b) and c), below, connect an ideal current source to the output to force current back into the output. Find the voltage at the output.
4.

$$
Z_{\text {inf }}=\frac{V_{\text {out }}}{-\mathrm{i}_{\text {out }}}
$$

## The Four Feedback Topologies

a) Voltage-mixing voltage-sampling (series-shunt)

c) Voltage-mixing current-sampling (series-series)

b) Current-mixing current-sampling (shunt-series)

d) Current-mixing voltage-sampling (shunt-shunt)

## Some examples of the different topologies

ECE 3510 Amplifier Feedback p7
a) Voltage-mixing voltage-sampling (series-shunt)
$R_{e}$ is the AC signal resistance from emitter to ground Input impedance: $\quad \mathrm{R}_{\mathrm{i}}=\mathrm{R}_{\mathrm{B} 1}\left\|\mathrm{R}_{\mathrm{B} 2}\right\| \beta \cdot\left(\mathrm{r}_{\mathrm{e}}+\mathrm{R}_{\mathrm{e}}\right)$
$\begin{array}{llll}\text { Output impedance: } R_{\mathrm{o}}=R_{C} \| r_{\mathrm{o}} & \text { Often neglected } & \mathrm{r}_{\mathrm{o}}=\frac{\mathrm{V}_{\mathrm{A}}}{\mathrm{I}_{\mathrm{C}}} & \begin{array}{l}\text { Early voltage. } \\ \text { AC collector resistance: } \\ \text { (guess } \mathrm{V}_{\mathrm{A}} \simeq 100 \mathrm{~V} \\ \text { if no data) }\end{array}\end{array}$ AC collector resistance: $\mathrm{r}_{\mathrm{c}}=\mathrm{R}_{\mathrm{C}}\left\|\mathrm{R}_{\mathrm{L}}\right\| \mathrm{r}_{\mathrm{o}}$

Voltage gain: $A_{v}=\frac{v_{o}}{v_{b}}=\frac{r_{c}}{r_{e}+R_{e}}$
OR: $\frac{v_{o}}{v_{S}}=\frac{R_{i}}{R_{S}+R_{i}} \cdot \frac{r_{c}}{r_{e}+R_{e}}$
Current gain: $A_{i}=\frac{i_{o}}{i_{i}}=\frac{r_{c}}{r_{e}+R_{e}} \cdot \frac{R_{i}}{R_{L}}=A_{v} \cdot \frac{R_{i}}{R_{L}}$
$R_{E}$ is the DC resistance from emitter to ground

c) Voltage-mixing current-sampling (series-series)

$$
\begin{aligned}
& \text { Input impedance: } \mathrm{R}_{\mathrm{i}}=\mathrm{R}_{\mathrm{B} 1}\left\|\mathrm{R}_{\mathrm{B} 2}\right\| \beta \cdot\left(\mathrm{r}_{\mathrm{e}}+\mathrm{R}_{\mathrm{e}}\right) \\
& \text { Output impedance: } \mathrm{r}_{\mathrm{o}} \quad \mathrm{r}_{\mathrm{o}}=\frac{\mathrm{V}_{\mathrm{A}}}{\mathrm{I}_{\mathrm{C}}} \quad \begin{array}{l}
\text { Early voltage. } \\
\text { (guess } \mathrm{V}_{\mathrm{A}} \simeq 100 \mathrm{~V} \\
\text { if no data) }
\end{array} \\
& \text { Transconductance } \mathrm{g}=\frac{1}{\mathrm{r}_{\mathrm{e}}+\mathrm{R}_{\mathrm{e}}}
\end{aligned}
$$

a) Voltage-mixing voltage-sampling (series-shunt)

d) Current-mixing voltage-sampling (shunt-shunt)

Input impedance: see op-amp data for $\mathrm{R}_{\mathrm{i}}$
Output impedance: $R_{\text {outf }}=\frac{R_{\text {out }}}{B}$ up to current limits of the op amp Voltage gain: $\quad 1+\frac{\mathrm{R}_{\mathrm{f}}}{\mathrm{R}_{1}}$
Feedback signal mixing is done within the op amp.

Input impedance: $\mathrm{R}_{\text {in }}$ for voltage input
Input impedance: $\simeq 0$ for current input if you remove $\mathrm{R}_{\text {in }}$
Output impedance: $R_{\text {outf }}=\frac{R_{\text {out }}}{B}$ up to current limits of the op amp
Voltage gain: $-\frac{\mathrm{R}_{\mathrm{f}}}{\mathrm{R}_{1}}$

Name:

1. Find the input impedance $\left(\mathbf{Z}_{\mathrm{in}}(\mathbf{s})\right)$ and output impedance $\left(\mathbf{Z}_{\mathrm{out}}(\mathbf{s})\right)$ of each of the circuits below.
a)

b)

2. Now hook circuit b), above to the output of circuit a). Find the input impedance $\left(\mathbf{Z}_{\mathbf{i n}}(\mathbf{s})\right)$ and output impedance $\left(\mathbf{Z}_{\text {out }}(\mathbf{s})\right)$ of the combination circuit.
3. The following is a model of a DC motor. Find the input and output impedances.

$$
\mathrm{N}=\mathrm{K}=\frac{\mathrm{v}_{1}}{\omega}=\frac{\mathrm{T}_{2}}{\mathrm{i}}
$$

Answers

$$
\mathbf{Z}_{\text {out }}=\frac{\frac{1}{C_{a}} \cdot s+\frac{R_{a}}{L_{a} \cdot C_{a}}}{s^{2}+\frac{R_{a}}{L_{a}} \cdot s+\frac{1}{L_{a} \cdot C_{a}}}
$$

b) $\mathbf{Z}_{\mathbf{i n}}=\frac{1}{\mathrm{C}_{\mathrm{b}} \cdot \mathrm{s}}+\frac{1}{\frac{1}{\mathrm{R}_{\mathrm{b}}}+\frac{1}{\mathrm{~L}_{\mathrm{b}} \cdot \mathrm{s}}}$
$\begin{aligned} \text { 1. a) } \mathbf{Z}_{\text {in }} & =\frac{1}{\mathrm{C}_{\mathrm{a}} \cdot \mathrm{s}}+\mathrm{R}_{\mathrm{a}}+\mathrm{L}_{\mathrm{a}} \cdot \mathrm{s} \\ \text { b) } \mathbf{Z}_{\text {out }} & =\frac{\frac{1}{\mathrm{C}_{\mathrm{b}}} \cdot \mathrm{s}}{\mathrm{s}^{2}+\frac{1}{\mathrm{R}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{b}}} \cdot \mathrm{s}+\frac{1}{L_{b} \cdot \mathrm{C}_{b}}}\end{aligned}$
2. $\mathbf{Z}_{\mathbf{i n}}=\frac{1}{\mathrm{C}_{\mathrm{a}} \cdot \mathrm{s}}+\frac{1}{\frac{1}{\mathrm{R}_{\mathrm{a}}+\mathrm{L}_{\mathrm{a}} \cdot \mathrm{s}}+\frac{1}{\frac{1}{\mathrm{C}_{\mathrm{b}} \cdot \mathrm{s}}+\frac{1}{\frac{1}{\mathrm{R}_{\mathrm{b}}}+\frac{1}{\mathrm{~L}_{\mathrm{b}} \cdot \mathrm{s}}}}}$

$$
\mathbf{Z}_{\mathbf{o u t}}=\frac{1}{\frac{1}{\frac{1}{C_{a} \cdot s+\frac{1}{R_{a}+L_{a} \cdot s}}+\frac{1}{C_{b} \cdot s}}+\frac{1}{R_{b}}+\frac{1}{L_{b} \cdot s}}
$$

3. $\quad \mathbf{Z}_{\text {in }}=\mathrm{R}_{\mathrm{a}}+\mathrm{L}_{\mathrm{a}} \cdot \mathrm{s}+\frac{\mathrm{K}^{2}}{\mathrm{~B}_{\mathrm{m}}+\mathrm{J}_{\mathrm{m}} \cdot \mathrm{s}}$

ECE 3510 homework AF1 p2

$$
\mathbf{Z}_{\text {out }}=\frac{1}{\frac{K^{2}}{R_{a}+L_{a} \cdot s}+B_{m}+J_{m} \cdot s}
$$

Go to ME Design day in the Union on Thursday, 4/20 sometime from 11:00 to 3:00.
See http://mech.utah.edu/newsroom/design-day/
Write several paragraphs about what you see there. Especially:

1. Note control systems and/or systems with feedback.
2. Tell which senior project most impressed you and why.
3. Observe at least part of one of the competitions (main mechatronics robot competition, 1:00-3:00) and write at least one paragraph about it (suggest improvements).

Name: $\qquad$ ECE 3510 homework AF2 Due: Sat, 4/15/23
Find your textbook from your electronics class (ECE 2280 here at the U). Find the chapter or section which covers feedback in amplifiers. Read the sections covering bandwidth or frequency response, noise reduction, distortion reduction and gain reduction.

## Amplifier Compensation

1. The plot at right shows the frequency response of an LF353 op amp.
a) Find the gain-bandwidth product (GBW).
b) Find $\mathrm{A}_{\mathrm{o}}$ in both dB and as a factor.
c) Find the open-loop roll-off point and the compensation pole location.

d) A voltage (series-shunt) feedback network is used to feed back $0.1 \%$ of the output back to the input in a negative manner. Find the closed-loop gain (as a factor and in dB) and the closed-loop roll-off point. Draw the closed-loop frequency response on the drawing above.
2. 

e) Now use two equal amplifier stages (two op amps) to achieve the same gain as part in d), Find the closed-loop roll-off point of a single stage. Draw the closed-loop frequency response of a single stage on the drawing above.

Would this also be the 3 dB roll-off point of the entire two-stage amplifier? If not, why not?

## ECE 3510 homework AF2 p2

2. Show that the low-frequency 3 dB roll-off point $=\omega_{\mathrm{Lf}}=\frac{\omega_{\mathrm{L}}}{1+\mathrm{A}_{\mathrm{o}} \cdot B}$

Note: To do this, you'll take the basic open-loop amplifier transfer function and use it to write the closed-loop transfer function. Unfortunately the result is pretty messy and it can be hard to see what you can reasonably leave out to approximate the closed-loop transfer function.
where:
$\mathrm{A}_{\mathrm{o}}=$ Midband gain of basic amplifier
B = the feedback factor
$\omega_{\mathrm{L}}=$ Low-frequency 3 dB roll-off point of basic amplifier
$\omega_{\mathrm{Lf}}=$ Low-frequency 3 dB roll-off point with feedback

A much easier approach is to pretend the basic amplifier doesn't have a high-frequency roll-off and eliminate the high-frequency pole from it's transfer function before you write the closed-loop transfer function. This is reasonable to do because the high-frequency roll-off will have very little effect on the low-frequency roll-off point.

## ECE 3510 homework AF2 p3

3. Draw the ideal series-shunt feedback topology. You may leave out the output impedance (or source resistance) of the input voltage and the input impedance of the feedback network. By "leave out" you may consider them to be zero and $\infty$, respectively.
4. Show that the input resistance with feedback is: $\quad R_{i f}=\left(1+A_{o} \cdot B\right) \cdot R_{i}$
where:
$\mathrm{A}_{\mathrm{o}}=$ the open-loop amplifier gain
$\mathrm{R}_{\mathrm{i}}=$ the open-loop input resistance
B = the feedback factor

## ECE 3510 homework AF2 <br> p4

5. Show that the output resistance with feedback is: $\quad R_{\text {of }}=R_{\text {of }}=\frac{R_{o}}{\left(1+A_{o} \cdot B\right)} \quad R_{o}=$ the open-loop output resistance

## Answers

1. a) $4 \cdot \mathrm{MHz}$
b) $110 \cdot \mathrm{~dB}$
$3.162 \cdot 10^{5}$
c) $12.65 \cdot \mathrm{~Hz}$
c) pole: $\frac{1}{s+79.5}$
d) $1000 \quad 60 \cdot \mathrm{~dB}$
$4 \cdot \mathrm{kHz}$
e) $126.5 \cdot \mathrm{kHz}$
e) The 3 dB roll-off point of the entire two-stage amplifier is a bit less than 126.5 kHz because that would actually be a 6 dB roll-off point.
