

# ECE 3510 Final Exam Study Guide

Zoom Review, 6:00 Wed, 4/27 Final is Thur, 4/28/22, starting at 10:30am

The first part will be **closed book, closed notes, no-calculator**, not even your exam note sheets.

When you hand in the first part you will get the second part, which will be **open note sheets only, with calculator**.

**Download old exams from HW page on class web site.**

## The exam will cover

1. Review the questions you were asked on the homeworks.
2. Laplace transforms, be prepared to look up and adapt table entries

Initial and final values

3. Inverse Laplace transforms (partial fractions)

4. Relationship of signals to pole locations

5. Boundedness and convergence of signals

Bounded if all poles in LHP, no double poles on  $j\omega$ -axis

Converges to 0 if all poles LHP. Converges to a non-zero value if a single pole is at zero

6.  $H(s)$  of circuits

$$\mathbf{Z}(s) \quad R \quad Ls \quad \frac{1}{Cs}$$

Be able to find  $\frac{\mathbf{V}_{out}(s)}{\mathbf{V}_{in}(s)}$

or any other output over input.  
Review voltage dividers and current dividers

7. Block Diagrams & their transfer functions

Standard feedback loop transfer function

8. BIBO Stability (Systems)

BIBO if all poles in LHP, no poles on  $j\omega$ -axis

9. Impulse & step responses  $h(t) = \frac{1}{s} \cdot \mathbf{H}(s)$

10. Steady-state (DC gain =  $\mathbf{H}(0)$ ) & transient step responses

11. Effects of pole locations on step response, see Fig 3.15, p.51.

12. Sinusoidal responses, effects of poles & zeros, etc.

Steady-state AC analysis to get  $\mathbf{Y}(j\omega)$  &  $y_{ss}(t)$

(Sinusoidal steady-state transfer function =  $\mathbf{H}(j\omega)$ )

Review complex math relations

Conversions

Add & Subtract

Multiply and divide

13. Transient sinusoidal response

You should be ready to do partial fraction

expansion to the first (transient) term from:

$$\mathbf{H}(s) \times A \cdot \frac{s}{s^2 + \omega^2} \quad \text{or} \quad B \cdot \frac{\omega}{s^2 + \omega^2}$$

14. The advantages of state space over classical frequency-domain techniques.

Multiple input / multiple output systems

Can model nonlinear systems

Can model time varying systems

Can be used to design optimal control systems

Can determine controllability and observability

# ECE 3510 Final Exam Study Guide p2

15. Effect of initial conditions

$$Y(s) = \frac{b_2 s^2 + b_1 s + b_0}{s^2 + a_1 s + a_0} X(s) + \frac{s y(0) + \frac{d}{dt} y(0) + a_1 y(0) - b_2 s x(0) - b_1 \frac{d}{dt} x(0) - b_1 s x(0)}{s^2 + a_1 s + a_0}$$

- a. The total response is the sum of two independent components.
- b. These values together fully describe the *state* of the 2nd-order system at time  $t = 0^-$  (the initial state):
 

$y(0^-)$	$\frac{d}{dt} y(0^-)$	$x(0^-)$	$\frac{d}{dt} x(0^-)$
----------	-----------------------	----------	-----------------------
- c. Similar denominator for both parts = Share poles = Similar responses
- d. Response to Initial conditions always go to zero if system is BIBO.
- e. Pole-zero cancellations in right-half plane can cause major problems with internal states of the system.

May give  $H(s)$ ,  $a$ 's &  $b$ 's  $x(0)$ s and  $y(0)$ s. and ask for effect of initial conditions

16. Electrical analogies of mechanical systems, particularly translational and rotational systems.

Review the handout and homeworks 8 & 9.

17. Control system characteristics and the objectives of a "good" control system. See p. 78

- Stable
- Tracking
  - fast
  - smooth
  - minimum error (often measured in steady state)
- Reject disturbances
- Insensitive to plant variations
- Tolerant of noise

Be able to relate these to poles and zeros on the real and Imaginary axis (where possible)

18. Elimination of steady-state error, p. 81.

DC

- 1 System stable
- 2  $C(s)$  or  $P(s)$  has pole @ 0
- 3  $C(s)$  or  $P(s)$  No zero @ 0

19. Rejection of constant disturbances, p. 82.

DC

- 1 System stable
- 2  $C(s)$  has pole @ 0
- 3 or  $P(s)$  has zero @ 0 But bad for above

20. Root - Locus method

a) Main rules and concepts (Memorize)

- 1. Root-locus plots are symmetric about the real axis.
- 2. On the real axis, spaces left of an odd number of O-L poles and zeros are always part of the locus. (Essentially, every other space on the real axis (counting leftward) is part of the plot.)

3. Each O-L pole originates ( $k = 0$ ) one branch. (n)

Each O-L zero terminates ( $k = \infty$ ) one branch. (m)

All remaining branches go to  $\infty$ . (n - m)

These remaining branches approach asymptotes as they go to  $\infty$ .

4. The origin of the asymptotes is the centroid.

centroid =  $\sigma =$

$$\frac{\sum_{\text{all}} \text{OLpoles} - \sum_{\text{all}} \text{OLzeros}}{n - m}$$

(# poles - # zeros)

5. The angles of the asymptotes

n - m	angles (degrees)		
2	90	270	
3	60	180	300
4	45	135	225

# ECE 3510 Final Exam Study Guide p3

6. The angles of departure (and arrival) of the locus are almost always:  OR: 

7. Gain at any point on the root locus:  $k = \frac{1}{|G(s)|}$

8. Complex angle of  $G(s)$  at any point on the root locus:  $\arg(G(s)) = \arg(N(s)) - \arg(D(s)) = \pm 180^\circ, \pm 540^\circ, \dots$

Or:  $\arg\left(\frac{1}{G(s)}\right) = \arg(D(s)) - \arg(N(s)) = \pm 180^\circ, \pm 540^\circ, \dots$

b) Additional Root locus rules. Review the handout. Open-book part only.

1. The breakaway points are also solutions to:  $\sum_{\text{all}} \frac{1}{(s + -p_i)} = \sum_{\text{all}} \frac{1}{(s + -z_i)}$

2. Departure angles from complex poles:

c) **Root Locus general, Interpretation and design**

1. Concepts of what a root locus plot is and what it tells you. Movement of poles
2. Good vs bad, fast response vs slow, OK damping vs bad.
3. Important conclusions from root locus, section 4.4.5, p. 105.
4. Compensators

Know pole & zero locations of P, PI, lag, PD, lead & PID Compensators.

PI and Lag, purpose and design, ties in with steady-state error

PD and Lead, purpose and design ties in with root locus angle rules

PID & lead-lag design order & why

Compensator Circuits

**Choose points** on the s-plane to achieve given required characteristics based on the 2nd-order assumption (RL Crib)

Know that the 2nd-order assumption may be inaccurate if other CL poles and/or zeros aren't 5x farther from Imaginary axis and are not canceling one another.

d) Unconventional root-locus

21. PID tuning Memorize some basic ideas, like why you would need to do it.

22. Ladder logic

23. **Bode Plots**

Be able to draw both magnitude and phase plots

Basic rules

Complex poles and zeros  $s^2 + 2 \cdot \zeta \cdot \omega_n \cdot s + \omega_n^2 = (s + a)^2 + b^2 = s^2 + 2 \cdot a \cdot s + a^2 + b^2$  Open-book part only.

natural frequency  $\omega_n = \sqrt{a^2 + b^2}$  damping factor  $\zeta = \frac{a}{\omega_n}$  max at approx  $\omega_n$ ,  $\frac{1}{2 \cdot \zeta}$   $20 \cdot \log\left(\frac{1}{2 \cdot \zeta}\right)$  dB

**Bode to transfer function**

GM, PM & DM

Estimate overshoot from phase margin and delay (HW NqBd)  $\zeta \approx \frac{PM}{100 \cdot \text{deg}}$  (PM in degrees and may include delay effects)

1. Feedback in Linear Amplifiers

Gain reduction and stabilization. Trade for other improvements.

$$A_f = \frac{A_o}{1 + A_o \cdot B}$$

Bandwidth Extension

Op-amp compensation and resulting bandwidth

Input and Output Impedances For voltage amp with voltage feedback:  $Z_{in}$  Depends on how feedback is implemented

$Z_{out}$  Decrease, usually by  $(1 + A_o \cdot B)$

Reduce distortion, especially distortion caused by nonlinear gains

Reduce amplifier noise. The later the noise is introduced in the amplifier, the greater the reduction.

2. Discrete signals  $x(k)$

3. z-transform 
$$X(z) = \sum_{k=0}^{\infty} x(k) \cdot z^{-k}$$

4. Finite-length signals have all poles at zero

Relationship of signals to pole locations, Fig 6.9. lines of constant damping

Time constant:  $\tau = -\frac{1}{\ln(|p|)}$

Settling time:  $T_s = 4 \cdot \tau$

Speed of decay Damping factor  $\zeta = \frac{-\ln(|p|)}{\sqrt{\ln(|p|)^2 - \theta_p^2}}$

6. Properties of the z-transform

linear

Right-shift = delay = multiply by  $z^{-1} = \frac{1}{z}$

Left-shift = advance = multiply by  $z$

Initial value =  $x(0) = X(\infty)$

Final value (DC) =  $x(\infty) = (z - 1) \cdot X(z) \Big|_{z := 1}$

7. Inverse z-transforms (partial fractions & long division)

Divide by z first:  $\frac{X(z)}{z}$

8. Nyquist sampling criterion, at least twice the highest signal frequency

9. Boundedness and convergence of signals, relate to continuous-time signals

Bounded if all poles in inside unit circle, no double poles on unit circle

Converges to 0 if all poles inside unit circle. Converges to a non-zero value if a single pole is at 1

10. Difference equations, be able to get  $H(z)$

Discrete-time systems, FIR (all poles at zero), IIR (some poles not at zero)

BIBO Stability, all poles inside unit circle.

11. Integration  $H(z) = \frac{z}{z - 1}$       Differentiation  $H(z) = \frac{z - 1}{z}$

12. Step & Sinusoidal responses, effects of poles & zeros, etc.

DC gain =  $H(1)$       sinusoidal:  $H(e^{j\Omega_o}) = |H| \angle \theta_H$  multiply magnitudes and add angles just like Laplace only  $j\omega$  is replaced with  $e^{j\Omega_o}$

13. Implementations (block diagrams), be able to go back and forth to  $H(z)$

General Interconnected Systems

14. Same Feedback system as in continuous-time and Root locus works the same but is interpreted very differently.
